CARB toroidal roller bearings

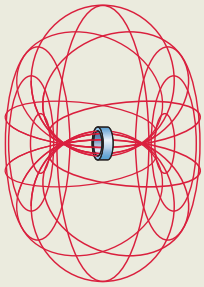
Fig. 1

CARB toroidal roller bearing

Fig. 2

A torus, with outer ring of CARB bearing at its centre



CARB toroidal roller bearings (**fig. 1**) have one row of long, slightly barrel-shaped symmetrical rollers and torus-shaped raceway profiles (**fig. 2**). They are non-locating bearings and accommodate exclusively radial loads. CARB bearings are often used to replace the non-locating spherical roller bearing in a locating/non-locating bearing arrangement.

Bearing features

- **Accommodate misalignment**
  CARB bearings are self-aligning like spherical roller bearings or self-aligning ball bearings (**fig. 3**).
- **Accommodate axial displacement**
  CARB bearings compensate for thermal expansion of the shaft like cylindrical or needle roller bearings (**fig. 4**).
- **Wide assortment of dimension series**
  CARB bearings are available with the same boundary dimensions as corresponding spherical roller bearings, self-aligning ball bearings, cylindrical roller bearings and needle roller bearings (**fig. 5**).
- **Long service life**
  The special roller profile prevents stress peaks at the roller ends (**fig. 6**).
- **Low friction**
  Self-guiding rollers keep friction and frictional heat at low levels (**fig. 7**).
- **Improved wear resistance**
  All CARB bearings are upgraded SKF Explorer bearings (**page 7**).
- **Low noise**
  CARB bearings can reduce noise and vibration levels, for example, in paper machines and fans.

Axial displacement

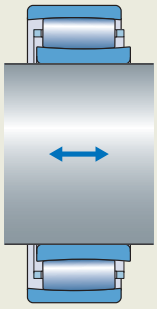

Fig. 6

Optimal stress distribution

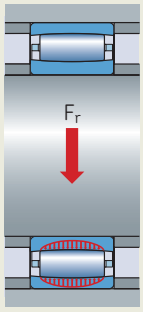

Fig. 7

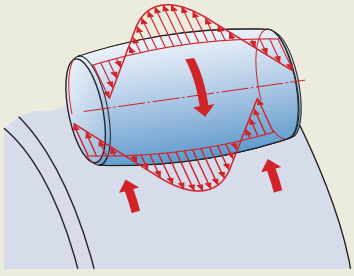
Low friction and frictional heat



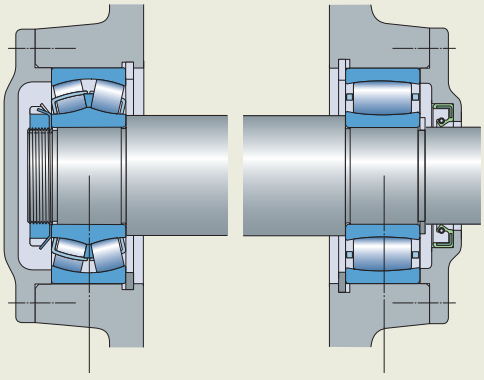
Long bearing system life

CARB bearings provide benefits in self-aligning bearing arrangements (**fig. 8**). With a CARB bearing in the non-locating position, there are no internally induced axial forces, which results in multiple benefits:

- Less load extends the service life.
- The bearings run cooler, the lubricant lasts longer and maintenance intervals can be extended.
- Noise and vibration levels can be reduced.

Fig. 8

Self-aligning bearing arrangement: Locating spherical roller bearing and non-locating CARB bearing



Designs and variants

SKF standard assortment

The SKF standard assortment of CARB toroidal roller bearings matches the assortment of spherical roller bearings. It also includes bearings with a low cross-sectional height to meet requirements for minimum radial space. All CARB bearings are upgraded SKF Explorer bearings and are shown coloured blue in the product tables. The standard assortment includes:

- basic design bearings with cylindrical or tapered bore
  - taper 1:12 (designation suffix K)
  - taper 1:30 (designation suffix K30)
- sealed bearings

For sizes and variants not listed in the product tables, contact SKF.

Basic design bearings

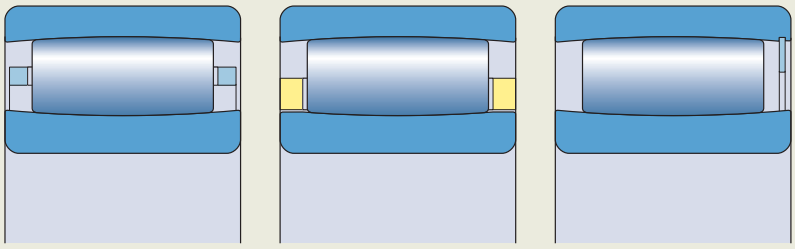
Depending on their series and size the following basic design CARB toroidal roller bearings are available as standard (**fig. 9**):

- bearings with a roller centred cage
- bearings with an inner ring centred cage
- full complement bearings with a retaining ring

The load carrying capacity of full complement CARB bearings is considerably higher than that of same-sized bearings with a cage.

Fig. 9

Basic designs



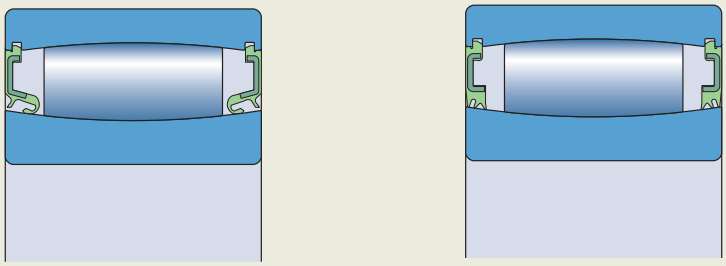
Bearing with a roller centred cage

Bearing with an inner ring centred cage

Full complement bearing with a retaining ring

Fig. 10

Sealed bearings



HNBR seals

NBR seals

Sealed bearings

- are available, as standard, as small and medium-size full complement bearings with a cylindrical bore
- are typically used for low speeds and very heavy loads
- are suitable for both inner or outer ring rotation
- are fitted with a double-lip contact seal on one or both sides in a recess on the outer ring, sealing against the inner ring raceway
- are available with two different seal materials / designs (**fig. 10**):
  - sheet steel reinforced HNBR (designation suffix CS5)
  - sheet steel reinforced NBR (designation suffix NS) with enhanced sealing effectiveness – mainly intended for oscillating or very low speed applications

Bearings sealed on both sides are lubricated for the life of the bearing and are virtually maintenance-free. They are filled with one of the following greases (**table 1**):

- bearings with HNBR seals → SKF LGHB 2 grease as standard
- bearings with NBR seals → SKF LGEP 2 grease as standard
- other SKF greases on request

For additional information about greases, refer to *Selecting a suitable SKF grease*, page 116, in *Rolling bearings*, PUB BU/P1 17000/1 EN.

Cages

CARB bearings, if not a full complement of rollers, are fitted with one of the following cages:

- glass fibre reinforced PA46 cage, window-type, roller centred (designation suffix TN9)
- stamped steel cage, window-type, roller centred (no designation suffix)
- machined brass cage, window-type, roller centred (designation suffix M)
- machined brass cage, inner ring centred (designation suffix MB)

When used at high temperatures, some lubricants can have a detrimental effect on polyamide cages. For additional information about the suitability of cages, refer to *Cages*, page 187, in *Rolling bearings*, PUB BU/P1 17000/1 EN.

Customized bearings

SKF can customize bearings to meet the needs of applications where the bearings are subjected to unique operating conditions. For example, bearings for:

- paper mills or coaters in high precision execution
- very arduous operating conditions, e.g. continuous casters
- high temperature applications

For additional information about application-specific CARB bearings, contact the SKF application engineering service.

Table 1

Technical specifications of SKF greases for sealed CARB bearings

Grease	Designation suffix	Temperature range[1]	Thickener	Base oil type	NLGI grade	Base oil viscosity [mm²/s] at 40 °C (105 °F)	Base oil viscosity [mm²/s] at 100 °C (210 °F)
		–50 0 50 100 150 200 250 °C –60 30 120 210 300 390 480 °F					
LGEP 2	VT143		Lithium soap	Mineral	2	200	16
LGHB 2	GEM9		Calcium sulphonate complex	Mineral	2	400	26.5

[1] Refer to the SKF traffic light concept (page 117 in *Rolling bearings*, PUB BU/P1 17000/1 EN).

Bearing data

Dimension standards	Boundary dimensions: ISO 15
Tolerances For additional information → page 35 in *Rolling bearings*, PUB BU/P1 17000/1 EN.	Normal **d ≤ 300 mm** • width tolerance at least 50% tighter than ISO standard (**table 2**) • P5 geometrical tolerances **d > 300 mm** • P5 geometrical tolerances on request (designation suffix C08) Values: ISO 492 (table 2, page 38, to table 4, page 40 in *Rolling bearings*, PUB BU/P1 17000/1 EN).
Internal clearance For additional information → page 182 in *Rolling bearings*, PUB BU/P1 17000/1 EN.	Normal Check availability of C2, C3, C4 or C5 clearance classes Values: ISO 5753-1 • cylindrical bore **(table 3)** • tapered bore (**table 4**, **page 10**) Values are valid for unmounted bearings under zero measuring load, with no misalignment, no axial displacement between the inner and outer rings, and the rollers centred. Axial displacement of one bearing ring relative to the other reduces the radial internal clearance. Typical clearance window → **diagram 1**, **page 12**.
Permissible misalignment	0.5° For misalignment > 0.5°, contact the SKF application engineering service.
Permissible axial displacement (fig. 11, page 12)	$s_{1\,max}$, $s_{2\,max}$ (**product table**, **page 18**) The actual internal clearance can limit the possible axial displacement. Misalignment reduces the possible axial displacement. For details, refer to *Verification of axial displacement*, **page 12**. Free space must be provided on both sides of the bearing (*Free space on both sides of the bearing*, **page 14**).

Loads

	Bearings with a cage	Full complement bearings
Minimum load For additional information → page 106 in *Rolling bearings*, PUB BU/P1 17000/1 EN.	$F_{rm} = 0.007\ C_0$ **Oil lubricated bearings:** $n/n_r \leq 0,3 \rightarrow F_{rm} = 0,002\ C_0$ $0,3 < n/n_r \leq 2 \rightarrow F_{rm} = 0,002\ C_0 \left(1 + 2 \sqrt{\frac{n}{n_r} - 0,3}\right)$	$F_{rm} = 0.01\ C_0$
When starting up at low temperatures or when the lubricant is highly viscous, greater minimum loads than $F_{rm} = 0.007\ C_0$ and $0.01\ C_0$, respectively, may be required.		
Equivalent dynamic bearing load For additional information → page 91 in *Rolling bearings*, PUB BU/P1 17000/1 EN.	$P = F_r$	
Equivalent static bearing load For additional information → page 105 in *Rolling bearings*, PUB BU/P1 17000/1 EN.	$P_0 = F_r$	
	Symbols C_0 basic static load rating [kN] (**product table**, **page 18**) F_r radial load [kN] F_{rm} minimum radial load [kN] P equivalent dynamic bearing load [kN] P_0 equivalent static bearing load [kN] n rotational speed [r/min] n_r reference speed [r/min] (**product table**)	

Temperature limits

The permissible operating temperature for CARB bearings can be limited by:

- the dimensional stability of the bearing rings
- the cage
- the seals
- the lubricant

Where temperatures outside the permissible range are expected, contact SKF.

Bearing rings

The rings of CARB bearings are heat stabilized up to 200 °C *(390 °F)*.

Cages

Steel or brass cages can be used at the same operating temperatures as the bearing rings. For temperature limits of polymer cages, refer to *Polymer cages*, page 188 in *Rolling bearings*, PUB BU/P1 17000/1 EN.

Seals

The permissible operating temperature for seals depends on the seal material:

- HNBR: –40 to +150 °C *(–40 to +300 °F)*
- NBR: –40 to +90 °C *(–40 to +195 °F)*
  Temperatures up to 120 °C *(250 °F)* can be tolerated for brief periods.

Typically, temperature peaks are at the seal lip.

Lubricants

Temperature limits for greases used in sealed CARB bearings are provided in **table 1**, **page 7**. For temperature limits of other SKF greases, refer to *Selecting a suitable SKF grease*, see page 116 in *Rolling bearings*, PUB BU/P1 17000/1 EN.

When using lubricants not supplied by SKF, temperature limits should be evaluated according to the SKF traffic light concept, see page 117 in *Rolling bearings*, PUB BU/P1 17000/1 EN.

Fig. 11

Permissible axial displacement

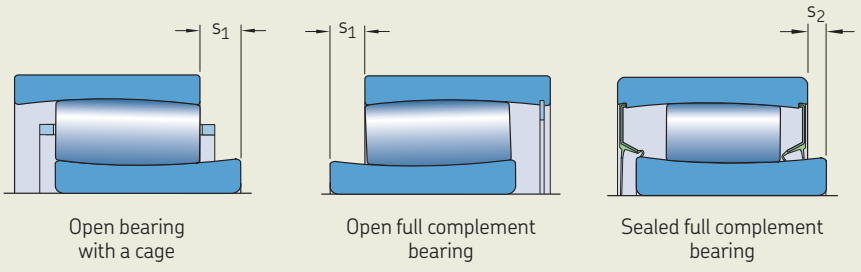

Diagram 1

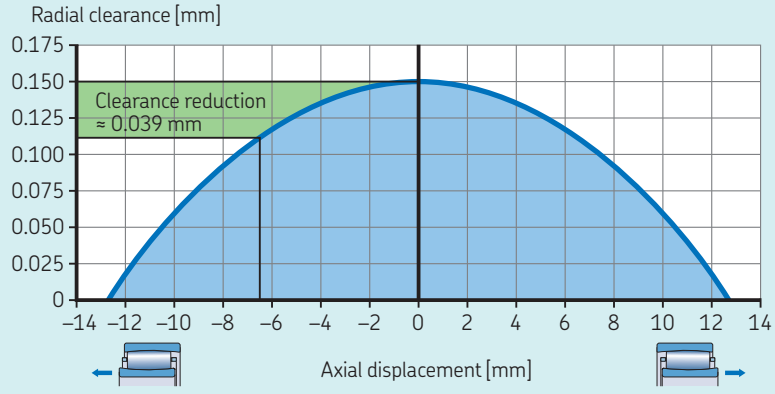
The clearance window for a C 3052 CARB bearing with a maximum operating clearance of 0.150 mm



Permissible speed

The speed ratings in the **product table** indicate:

- the **reference speed**, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the **limiting speed**, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

For additional information, refer to *Operating temperature and speed*, see page 130 in *Rolling bearings*, PUB BU/P1 17000/1 EN.

Design considerations

Verification of axial displacement

The actual internal clearance can limit the possible axial displacement. Misalignment reduces the possible axial displacement. Therefore, the actual axial displacement should be verified.

1 Determine the required axial displacement

- Thermal expansion of the shaft can be estimated using
  $s_{req} = \alpha\, L\, \Delta T$
- Where additional effects need to be considered, advanced simulation or tests may be required.

2 Determine the maximum misalignment

– Estimate the misalignment β of the housing seats based on specified tolerances.
– Where additional effects need to be considered, advanced simulation or tests may be required.

3 Check the permissible axial displacement

Check the permissible axial displacement in both directions, depending on the bearing used (**fig. 11**):
– open bearing with a cage
– full complement bearing with a retaining ring
– sealed bearing

$$s_{req} < s_1 - \beta\, k_1\, B$$

or

$$s_{req} < s_2 - \beta\, k_1\, B$$

Where s_{req} is too large, consider *Offset mounting*, **page 14**.

4 Check the internal clearance

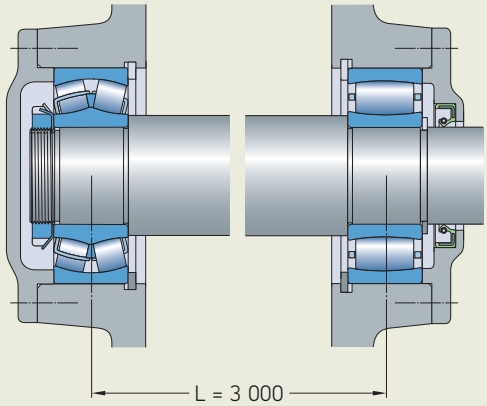
– Determine the clearance reduction caused by axial displacement.

$$C_{red} = \frac{k_2\, s_{req}^2}{B}$$

– Determine the amount of clearance reduction from other effects and evaluate the residual clearance (*Selecting initial internal clearance*, see page 183 in *Rolling bearings*, PUB BU/P1 17000/1 EN.

Fig. 12

Example application



Symbols

B	bearing width [mm]
C_{red}	reduction of radial clearance as a result of an axial displacement from a centred position [mm]
k_1	misalignment factor (**product table**, **page 18**)
L	shaft length between the bearings [mm]
s_1	axial displacement limit in bearings with a cage or in full complement bearings when displacing away from the retaining ring [mm] (**fig. 11**)
s_2	axial displacement limit in sealed and full complement bearings when displacing toward the seal or retaining ring respectively [mm] (**fig. 11**)
s_{req}	required axial displacement from a centred position [mm]
α	thermal coefficient of expansion [°C^{-1}] = 12 × 10^{-6} for steel
β	misalignment [°]
ΔT	temperature difference [°C]

Calculation example

Application (**fig. 12**)
- Bearing C 3040
  – d = 200 mm
  – D = 310 mm
  – B = 82 mm
  – Normal clearance: min. 170 µm
  – s_1 = 15.2 mm
  – k_1 = 0.123
  – k_2 = 0.095
- Shaft length L = 3 000 mm
- Temperature range for the shaft: 20 to 90 °C (*70 to 195 °F*)
- Max. misalignment: 0.46°

Verification of axial displacement:

1 Required axial displacement
$s_{req} = \alpha\, L\, \Delta T$
$s_{req} = 12 \times 10^{-6} \times 3\,000 \times (90 - 20)$
= 2.5 mm

2 Max. misalignment
Input provided: 0.46°

3 Checking the permissible axial displacement
$s_{req} < s_1 - \beta\, k_1\, B$
$2.5 < 15.2 - 0.46 \times 0.123 \times 82 \approx 10.5$
→ okay

4 Checking the internal clearance

$$C_{red} = \frac{k_2\, s_{req}^2}{B}$$

$$C_{red} = \frac{0.095 \times 2.5^2}{82} \approx 0.007$$

Min. internal clearance when the bearing is displaced:
170 – 7 = 163 µm

Determine the clearance reduction caused by other effects (e.g. interference fit, temperature difference between inner and outer rings) and evaluate the residual clearance (*Selecting initial internal clearance*, see page 183 in *Rolling bearings*, PUB BU/P1 17000/1 EN).

Free space on both sides of the bearing

To enable axial displacement of the shaft relative to the housing, free space must be provided on both sides of the bearing as indicated in **fig. 13**. The value for the width of this free space is based on:

- the value C_a (**product table**, **page 18**)
- the expected axial displacement of the bearing rings from the central position during operation
- the displacement of the rings caused by misalignment

Calculating the free space required on both sides of the bearing

$$C_{areq} = C_a + 0.5\,(s + \beta\, k_1\, B)$$

where

B = bearing width [mm]
C_a = minimum width of space required on both sides of the bearing [mm] (**product table**)
C_{areq} = width of space required on both sides of the bearing [mm]
k_1 = misalignment factor (**product table**)
s = relative axial displacement of rings, e.g. thermal shaft expansion [mm]
β = misaligment [°]

Offset mounting

Where considerable thermal changes in shaft length are a possibility, the inner ring can be mounted offset, relative to the outer ring, up to the axial displacement limit s_1 or s_2 (**fig. 11**, **page 12**) in the direction opposite to the expected axial displacement (**fig. 14**). The extended permissible axial displacement is used, for example, in the self-aligning bearing arrangements of drying cylinders in paper machines.

Fig. 13

Free space to enable axial displacement

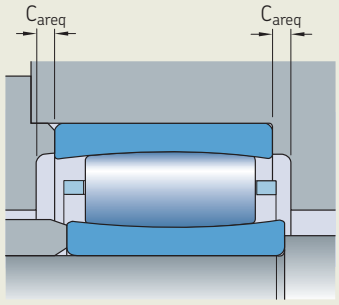


Fig. 14

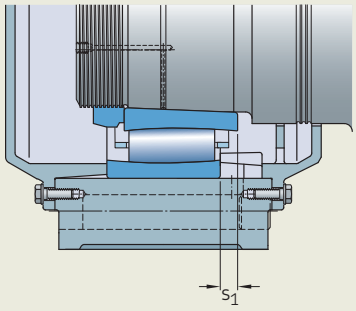
Bearing rings mounted offset to accommodate shaft expansion



Bearings on sleeves

CARB bearings with a tapered bore can be mounted with:

- an adapter sleeve on plain or stepped shafts (**fig. 15**):
  - Adapter sleeves are supplied complete with a locking device.
  - Use appropriate SKF adapter sleeve assemblies to prevent the locking device from interfering with the cage (**product table**, **page 30**).
- a withdrawal sleeve on stepped shafts (**fig. 16**)

Check axial displacement carefully, as it could be that s_1 (**product table**, **page 18**) cannot be fully realized.

For additional information about sleeves, refer to *Adapter sleeves*, page 1065, and *Withdrawal sleeves*, page 1087 in *Rolling bearings*, PUB BU/P1 17000/1 EN.

Appropriate bearing housings

SKF standard bearing housings are available for most CARB bearings in the C 30, C 31, C 22 and C 23 series.

The two common arrangements when using standard housings are:

- CARB bearings with a tapered bore on an adapter sleeve and a plain shaft
- CARB bearings with a cylindrical bore on a stepped shaft

The comprehensive assortment of SKF bearing housings is provided online at skf.com/housings.

Mounting

During handling, the rings and roller complement of CARB toroidal roller bearings may be axially displaced from their normal position. This is especially likely where CARB bearings are mounted with the shaft or housing in the vertical position:

1 The roller complement, together with the inner or outer ring, will move downward and result in no more clearance.
2 When the bearing rings expand or contract as a result of an interference fit, preload is likely to result.

Therefore, wherever possible:

- Mount CARB bearings with the shaft or housing in the horizontal position.
- Rotate the inner or outer ring to align the rollers during mounting.
  Where this is not feasible, use a bearing handling tool or other device to keep the bearing components arranged centrally.

Mounting bearings with a tapered bore

Bearings with a tapered bore are mounted with an interference fit, by using one of the following methods:

1 **Measuring the clearance reduction (table 5, page 16)**

2 **Measuring the lock nut tightening angle (table 5)**

3 **Measuring the axial drive-up (table 5)**

4 **Applying the SKF Drive-up Method**
For bearings with d > 100 mm, SKF recommends using the SKF Drive-up Method. This is a fast, reliable and safe method to achieve the appropriate interference fit. Additional information is available online at skf.com/drive-up.

5 **Measuring the inner ring expansion**
Additional information is available online at skf.com/sensormount.

For additional information about these mounting methods, refer to *Mounting bearings with a tapered bore*, page 203 in *Rolling bearings*, PUB BU/P1 17000/1 EN or the *SKF bearing maintenance handbook*.

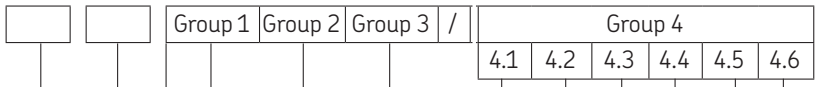
1 400	**1 600**	0.7	0.85	9.1	11.1	22.7	27.7	
1 600	**1 800**	0.79	0.96	10.2	12.5	25.6	31.2	

Applying the recommended values prevents the inner ring from creeping. but does not ensure correct radial internal clearance in operation. Additional influences from the bearing housing fit and temperature differences between the inner and outer rings must be considered carefully when selecting the bearing radial internal clearance class (*Selecting initial internal clearance* see page 183 in *Rolling bearings*, PUB BU/P1 17000/1 EN).

1) Not valid for the SKF Drive-up Method.
2) The listed values are valid only for solid steel shafts and general applications. They are to be used as guideline values only, as it is difficult to establish an exact starting position. Also, the axial drive-up, s, differs slightly between the different bearings series.

Designation system



Prefixes

ZE Bearing with SensorMount feature

Basic designation

Listed in **table 4**, **page 30**

Suffixes

Group 1: Internal design

Group 2: External design (seals, snap ring groove, etc.)

-CS5, -2CS5 Contact seal, HNBR, on one or both sides
-NS, -2NS Contact seal, NBR, on one or both sides
K Tapered bore, taper 1:12
K30 Tapered bore, taper 1:30

Group 3: Cage design

– Stamped steel cage, roller centred
M Machined brass cage, roller centred
MB(1) Machined brass cage, inner ring centred
TN9 Glass fibre reinforced PA46 cage, roller centred
V Full complement of rollers (no cage)

Group 4.1: Materials, heat treatment

HA3 Case-hardened inner ring

Group 4.2: Accuracy, clearance, preload, quiet running

C08 Geometrical tolerances to class P5
C2 Radial internal clearance smaller than Normal
C3 Radial internal clearance greater than Normal
C4 Radial internal clearance greater than C3
C5 Radial internal clearance greater than C4

Group 4.3: Bearing sets, matched bearings

Group 4.4: Stabilization

S3 Bearing rings heat stabilized for operating temperatures ≤ 300 °C *(570 °F)*

Group 4.5: Lubrication

GEM9 Filled to 70 – 100% with SKF LGHB 2 grease

Group 4.6: Other variants

VE240 Bearing with shorter rollers
VG114 Surface-hardened stamped steel cage
VM118 Full complement bearing without retaining ring
VT143 Filled to 25 – 45% with SKF LGEP 2 grease

1 CARB toroidal roller bearings
